DARPA RTRAIN

WTI was awarded a research and development contract for a Defense Applied Research Agency (DAPRA) program named "Force Multipliers for Urban Area Operations" in April 2005.

WTI and our subcontractor, VisiTech LLC, conduct research into and develop a **Rapid Training Environment (RTRAIN) Applied to Contemporary Urban Warfare**. RTRAIN addresses two current and compelling challenges facing the urban warrior's ability to effectively accomplish his mission. The first challenge is the ability to provide urban warriors a deployable training capability that reflects actual operational situations using real world data representations. The second is the technical capability to access real world operational data and rapidly package these data into a format usable by training and simulation systems.

The RTRAIN objective is to provide soldiers and marines much needed capability to train a small unit in urban warfare tactics using data and situational representations based on real experience and actual conditions. RTRAIN will reduce the time required to collect, adapt and incorporate disparate data for simulation based training from weeks to hours.
